

Lab Instructions - session 1

Introduction to numpy and matplotlib

A review of numpy arrays and matrices + matplotlib

Open an interactive Python environment (python shell, ipython shell, Jupyter notebook, Google Colab), run the following commands, and see the output. Do not close the environment

Creating numpy arrays

```
>>> l = [1,2,3]
>>> l
>>> import numpy
>>> a = numpy.array(l)
>>> a
>>> a[2] = 300
>>> a

>>> type(l)
>>> type(a)

>>> import numpy as np
>>> a = np.array(l)
>>> a

>>> a = np.zeros(10)
>>> a
>>> a.dtype
>>> a[2] = 4
>>> a

>>> a = np.zeros(10, dtype=np.int64)
>>> a
>>> a.dtype
>>> a = np.ones(10)
>>> a
>>> a = np.ones(10) * -20
>>> a
>>> np.full(10, 222)
>>> a = np.arange(10)
>>> a
>>> 2**a
```

Numpy array basic properties

```
>>> a = np.ones(10000)
>>> len(a)
>>> a.shape
>>> type(a)
>>> a.size
>>> a.ndim
>>> a.dtype
>>> a.nbytes
>>> a.itemsize

>>> import sys
>>> sys.getsizeof(a)
```

- Why are the outputs of `a.nbytes` and `sys.getsizeof(a)` different?

Lists vs. numpy arrays

```
>>> l1 = [1,2,3]
>>> l2 = [4,5,6]
>>> a1 = np.array(l1)
>>> a2 = np.array(l2)
>>> l1+l2
>>> a1+a2
```

Data types

```
>>> a = np.array([1,2,3,4,5,6,7,8,9,10], dtype=np.int64)
>>> b = np.array([1,2,3,4,5,6,7,8,9,10], dtype=np.int32)
>>> c = np.array([1,2,3,4,5,6,7,8,9,10], dtype=np.int16)
>>> d = np.array([1,2,3,4,5,6,7,8,9,10], dtype=np.int8)
>>> e = np.array([1,2,3,4,5,6,7,8,9,10], dtype=np.uint8)
>>> print(a.itemsize, b.itemsize, c.itemsize, d.itemsize, e.itemsize)
>>> print(a.nbytes, b.nbytes, c.nbytes, d.nbytes, e.nbytes)

>>> d-4
>>> e-4

>>> f = np.array([1,2,3,4,5,6,7,8,9,10], dtype=np.float32)
>>> g = np.array([1,2,3,4,5,6,7,8,9,10], dtype=np.float64)
>>> h = np.array([1,2,3,4,5,6,7,8,9,10], dtype=np.float128)
>>> print(f.nbytes, g.nbytes, h.nbytes)

>>> l = np.array([False, True, True])
```

```
>>> l.dtype
>>> l = np.array([0, 1, 1], dtype=np.bool)
>>> l.dtype
>>> l.nbytes
```

Basic operations

```
>>> a = np.array([1,2,3])
>>> b = np.array([4,5,6])
>>> a+b
>>> a-b
>>> a*b
>>> b**a
>>> a + 4
>>> a * 2
>>> a ** 2
>>> a.dtype
>>> a/b          # different in python 2.x and 3.x
>>> a//b

>>> a = np.array([1.0,2,3])
>>> a
>>> a.dtype
>>> a / b
>>> a//b        # different in python 2.x and 3.x

>>> a = np.array([1,2,3], dtype=np.float64)
>>> a
>>> a.dtype
```

Slicing

```
>>> a = np.array([0,10,20,30,40, 50, 60, 70, 80, 90, 100])
>>> a
>>> a[2]
>>> a[-2]
>>> a[2:8]
>>> a[2:-1]
>>> a[2:]
>>> a[:8]
>>> a[2:8:2]
>>> a[2:8:-1]
>>> a[8:2:-1]
>>> a[::-1]
>>> a[[1,3,3,4,5]]
```

2D Arrays

```
>>> A = np.zeros((4,6))
>>> A
>>> A = np.zeros((4,6), dtype=np.int32)
>>> A
>>> A = np.ones((3,7))
>>> A
>>> A = np.ones((3,8), dtype=np.uint8)
>>> A
>>> np.full((4,3), 50.0)
>>>
>>> A = np.array([[1,2,3,4], [5,6,7,8], [9,10,11,12]])
>>> A[1,2]
>>> A[0,-1]
>>> A[1,2]
>>> A.shape
>>> A.shape[0]
>>> A.shape[1]
>>> A.shape[:-1]
>>> A.size
>>> A.ndim
>>>
>>> A[0]
>>> A[1]
>>> A[0].shape
>>> A[0,:]
>>> A[0,:].shape
>>> A[[0],:]
>>> A[[0],:].shape
>>> A[:,2]
>>> A[:,[2]]
>>> A[:,2].shape
>>> A[:,[2]].shape
>>>
>>> A[1:3]
>>> A[1:3, :]
>>> A[:, :3]
>>> A[:, :2]
>>> A[:, :-1]
>>>
>>> r = np.array([0, 1, 0, 2, 2])
>>> A
>>> r
>>> A[r,:]
```

```
>>>
>>> A
>>> A[:,0] = 1
>>> A
>>> A[:,0] = [20,30,40]
>>> A
>>>
>>> A
>>> A.T
>>>
>>> B = np.array([[1,1,1,1], [2,2,2,2], [3,3,3,3]])
>>> A
>>> B
>>> A + B
>>> A * B
>>>
>>> np.dot(A,B)
>>> A.dot(B)
>>> A @ B
>>> A.dot(B.T)
>>>
>>> I = np.eye(3)
>>> I
>>>
>>> np.random.random((2,3))
>>> np.random.random((2,3))
>>> np.random.random((2,3))
>>>
>>> np.random.rand(2,3)
>>> np.random.rand(2,3)
>>>
>>> np.random.randn(2,3)
>>> np.random.randn(2,3)
```

Numpy slices are references (not copies)

```
>>> A = np.array([[1,2,3,4], [5,6,7,8], [9,10,11,12]])
>>> b = A[:,1]
>>> b
>>> A
>>> b[1] = 10000
>>> b
>>> A
>>>
>>> b = A[:,0].copy()
>>> b
>>> b[1] = -20000
```

```
>>> b  
>>> A
```

Masks

```
>>> A = np.array([[1,2,3,4],  
                 [5,6,7,8],  
                 [9,10,11,12]])  
>>> Mask = np.array([[True,  False,  True,  False],  
                    [True,  True,   False, False],  
                    [False, False,  False, True]])  
>>> Mask.dtype  
>>> A  
>>> A[Mask]  
>>> A[~Mask]  
>>> A[Mask] = 222  
>>> A  
>>> A[~Mask] *= 2  
>>> A  
  
>>> A = np.array([[1,2,3,4], [5,6,7,8], [9,10,11,12]])  
  
>>> B = np.zeros_like(A)  
>>> B[Mask] = A[Mask]  
>>> B  
  
>>> A > 2  
>>> Mask = A < 8  
>>> Mask  
>>> A[Mask]  
>>> A[A < 8]  
>>> A[A < 8] += 100  
>>> A
```

Operations on arrays

```
>>> A = np.array([[1,2,3,4], [5,6,7,8], [9,10,11,12]])  
>>> A.sum()  
>>> A.sum(axis=0)  
>>> A.sum(axis=1)  
>>> A.min()  
>>> A.min(axis=0)  
>>> A.max(axis=0, keepdims=True)  
>>>  
>>> A.max(axis=1)  
>>> A.max(axis=1, keepdims=True)
```

```
>>> A.mean(axis=1)
>>>
>>> A.prod(axis=0)
```

Concatenation

```
>>> X = np.array([[1,2],[3,4]])
>>> Y = np.array([[10,20,30],[40,50,60]])
>>> Z = np.array([[7,7],[8,8],[9,9]])
>>> X
>>> Z
>>> np.concatenate((X,Z))
>>> np.concatenate((X,Z), axis=0)
>>> X
>>> Y
>>> np.concatenate((X,Y), axis=1)
>>> np.vstack((X,Z))
>>> np.r_[X,Z]
>>> np.hstack(X,Y)      # error
>>> np.hstack((X,Y))
>>> np.c_[X,Y]
>>> Y
>>> np.tile(Y,(4,3))
```

Reshaping

```
>>> A = np.array([[1,2,3,4],[5,6,7,8],[9,10,11,12]])
>>> A.reshape((4,3))
>>> A.reshape((2,6))
>>> A.reshape((2,7))
>>> A.reshape((1,12))
>>> A.reshape((12,1))
>>> A.reshape((12,))

>>> b = A.ravel()
>>> b
>>> b.shape
>>> b.reshape((2,6))

>>> b
>>> b.shape = (2,6)
>>> b
```

```
>>> f = A.flatten()
>>> r = A.ravel()
>>> f
>>> r

>>> f[0] = 4444
>>> f
>>> A

>>> r[0] = 4444
>>> r
>>> A
```

- What is the difference between `ravel` and `flatten`? Which one do you think is faster?

Numpy arrays vs numpy matrices

```
>>> A = np.array([[1,2,3], [1,1,1], [-1,-2,-1]])
>>> A
>>> A*A          # element-wise multiplication
>>> A.dot(A)     # matrix multiplication
>>> A @ A        # matrix multiplication (same as above)
>>>
>>> M = np.matrix([[1,2,3], [1,1,1], [-1,-2,-1]])
>>> M*M
>>> np.multiply(M,M)

>>> M=np.mat(A)
>>> M
>>> M=np.matrix(A)
>>> M
>>> M.T
>>> M.I
>>> M.I * M
>>> M * M.I
>>> M.A
>>> type(M)
>>> type(M.A)

>>> C = np.matrix("1 2; 3 4; 5 6")
>>> C
>>> M*C
```

N-dimensional arrays

```
>>> A = np.zeros((2,4,3))
>>> A
>>> A.shape

>>> A[:, :, 0].shape
>>> A[:, :, 0] = [[1,2,3,4], [5,6,7,8]]
>>> A[:, :, 1] = [[2,2,2,2], [4,4,4,4]]
>>> A[:, :, 2] = [[10,20,30,40], [11,21,31,41]]
>>> A
>>>
>>> A[0, :, :]
>>> A[0]

>>> A[:, 1, :]
>>> A[:, 1]
>>> A[:, [1]]

>>> A[:, 1].shape
>>> A[:, [1]].shape

>>> A[:, :, 0]
>>> A[:, :, 2]
>>> A[:, 2:, 2]
>>> A.ravel()
```

Broadcasting

```
>>> A = np.array([0,1,2,3,4,5,6,7])
>>> A - 10
>>> a = np.array([4])
>>> A * a
>>>

>>> A = np.array([[1,2,3,4], [5,6,7,8], [9,10,11,12]])
>>> b = np.array([1, 0, 2, -2])
>>> A
>>> b
>>> A-b
>>>

>>> c = np.array([1,2,3])
>>> A-c
>>> A-c.reshape((3,1))
>>>
>>>
```

```
>>> A = np.arange(24).reshape((2,3,4))
>>> A.shape
>>> A - 2
>>> A - np.array([1,2])
>>> A - np.array([1,2,3,4])
>>> A - np.array([1,2,3])
>>> A - np.array([1,2,3]).reshape((3,1))
>>> A - np.array([1,2])
>>> A - np.array([1,2]).reshape((2,1,1))
>>> A - np.array([[1,2,3,4],[5,6,7,8],[9,10,11,12]])
>>> A - np.array([[1,2,3,4],[5,6,7,8]])
>>> A - np.array([[1,2,3,4],[5,6,7,8]]).reshape((2,1,4))
```

To get a better understanding of broadcasting, read the following (particularly the broadcasting rules) <https://numpy.org/doc/stable/user/basics.broadcasting.html>

Math functions

```
>>> x = np.arange(0, 2 * np.pi, 0.1)
>>> x
>>> y = np.cos(x)
>>> y
>>> np.sin(x)
>>> np.tan(x)

>>> x = np.linspace(1,8,20)
>>> x
>>> x.shape
>>> np.exp(x)

>>> np.log(x)
>>> np.log10(x)
>>> np.log2(x)
>>> np.floor(x)
>>> np.ceil(x)
>>> np.round(x)

>>> np.sqrt(x)
>>> np.arctan(x)
```

- Here you can find a list of numpy math functions:
 - <https://numpy.org/doc/stable/reference/routines.math.html>

Plotting with Matplotlib

```
>>> from matplotlib import pyplot as plt
>>>
>>> x = np.arange(0, 2 * np.pi, 0.1)
>>> x
>>> y = np.cos(x)
>>> y
>>> plt.plot(x,y)
>>> plt.show()

>>> plt.plot(x,np.sin(x))
>>> plt.plot(x,np.cos(x))
>>> plt.show()
```

Reading and storing audio files

Read the following code (audio.py in the supplementary files) and run it.

audio.py

```
import numpy as np
import scipy.io.wavfile
import matplotlib.pyplot as plt

sampling_rate, data = scipy.io.wavfile.read('voice1.wav')

print('sampling rate:', sampling_rate) # frequency (sample per second)
print('data type:', data.dtype)
print('data shape:', data.shape)

N, no_channels = data.shape # signal length and no. of channels

print('signal length:', N)

channel0 = data[:,0]
channel1 = data[:,1]

scale = 2*np.linspace(-2,4, N)

plt.plot(np.arange(N), scale)
plt.show()

print('shape_old:', scale.shape)
scale.shape = (N,1)
print('shape_new:', scale.shape)

data_new = np.int16(scale * data)

scipy.io.wavfile.write('output1.wav', sampling_rate, data_new)
```

- Play the audio file **voice1.wav**.
- Run the code to create **output1.wav**. Play the output audio file **output1.wav**.
- What is the above doing?
- What data type has been used for storing audio signals in a **.wav** file? Is it signed or unsigned?
- What are the variables **N** and **sampling_rate**. The audio signal has **N** samples played at **sampling_rate** samples per second. Calculate the length of the signal in seconds. Verify your answer by opening **voice1.wav** in an audio player.

- Why does the array `data` have two columns? What are the columns of `data`? Is this a mono or stereo audio?
- What is the array `scale`? How is it used here?
- Why did we change the shape of the `scale` array from `N` to `(N,1)`?
- What does the line `data_new = np.int16(scale * data)` do?
- Why did we cast the output data to `int16` (16-bit signed integer)?

Task 1 - Practice Vectorization

Consider an arbitrary `A` matrix like

```
A = np.random.rand(200,10)
```

We perform the following operation on `A` to create the matrix `B`.

```
mu = np.zeros(A.shape[1])
for i in range(A.shape[0]):
    mu += A[i]
mu /= A.shape[0]

B = np.zeros_like(A)
for i in range(A.shape[0]):
    B[i] = A[i] - mu
```

- What does the above piece of code do?
- Write an equivalent program **without loops**. Do it in just **a single line of code**.

```
B = ...
```

Task 2

Plot the two channels of the input audio file (columns of the array `data`).

- Plot the two channels together in the same axes (like in the **sin** and **cos** example above)
- Analyse the audio signal. How does it correspond to what is said in the audio file?
- Use the zoom tool  to zoom in the plot. How does an audio signal look like?
- Plot both channels using a single `plt.plot` function. This can be done by directly giving the array `data` as the second argument of `plt.plot`.
- Plot the channels of the output data (`data_new`). How has the shape changed compared to the input signal? Why?

Task 3

- Save the output audio using a different sampling rate. Try different choices such as `sampling_rate*2` and `sampling_rate//2`. What happens?

Task 4

Change the file `audio.py` to, instead of scaling the signal, reverse it. Play the output to see how the audio sounds when played backwards.

- (Optional) Try using it on different audio files. Combine it with task 2. Have fun!
